

LOCAL AND STANDARD VOLUME TABLES FOR MAPLE (*ACER CAESIUM*) OF AZAD KASHMIR AND N.W.F.P.

M. AFZAL CHEEMA*
MOHAMMAD ALIUL HASNAIN FATIME**

Introduction

Maple (*Acer caesium*) is a useful broad leaved tree and grows naturally alongwith other broad leaved trees in the conifer forests of N.W.F.P., Punjab and Azad Kashmir. Its timber is used in furniture, wood articles, carving and especially for bobbins of textile industry.

Data from some trees were collected from different localities of N.W.F.P. which were insufficient for the preparation of volume tables of the species. After supplementing the above data from Azad Kashmir the present volume tables have been prepared.

Basic Data

The volume tables are based on data collected from 233 trees ranging from 5 inches (13 cms) to 49 inches (124 cms) diameter at breast height (51 from NWFP and 182 from A. Kashmir). A graph was drawn between timber volumes and $\frac{D^2 H}{100}$ for scrutiny of data 38 abnormal trees were rejected. Finally 194 trees upto maximum dbh 43 inches (109 cm) were taken for the preparation of these volume tables.

Method and Procedure

51 trees from NWFP forests were measured as per standard procedure for measurement of sample tree (5). Volume upto 2 inch (5 cm) diameter overbark at thin end of the stem (including branches) was taken as total volume of the tree. Data on 182 trees from different localities of Azad Kashmir were measured by Forest Research Division of Azad Kashmir upto 8 inch thin end of the stem and branch wood. Total volume of timber and smallwood of different logs of a tree were calculated using Huber/Smalian formulae and were summed to get volume of timber and smallwood separately for each tree. The estimates of heights and volume (timber and smallwood separately) against dbh classes were obtained through regression equation.

Following models were used for these estimations.

(i) Models for total height.

$$H = a + b \log D$$

$$H = a + b D + c D^2$$

* Assistant Biometrician P.F.I., Peshawar.

** Divisional Forest Officer Forest Research Division, Muzaffarabad Azad Kashmir.

(ii) Models for timber volume.

$$V_{(tim)} = a + b \frac{D^2 H}{100}$$

$$V_{(tim)} = a + b \frac{D^2 H}{100}$$

$$V_{(tim)} = a + b D + c H$$

(iii) Model for smallwood volume.

$$V(S/W) = a + b \frac{D^2 H}{100}$$

Where H stands for total height in feet.

D stands for diameter at breast height in inches.

$V_{(tim)}$ stands for total timber volume.

$V(S/W)$ stands for total smallwood volume.

log stands for common logarithms (to the base 10).

The developed equations are given in APPENDIX I alongwith their measures of precision.

Height estimation:

Regression equations for height estimation are presented in APPENDIX I from serial No. 1 to 2. The measures of precision for both equations are not so strong due to great variation in heights of different sized trees. However, these measures i.e. correlation coefficient and SE of estimates are better in case of equation 1 i.e., $H = 8.296412 + 59.833510 \log D$.

The above equation was therefore used for the estimation of heights against dbh classes (Appendix II). Estimated values were rounded to whole numbers.

Over bark timber volume estimation

On the basis of better measures of precision, regression equation number 3 of APPENDIX I, i.e. $V_{(tim)} = 0.342872 + 0.002203 D^2 H$ was used for estimation of timber (o.b.) volume. (APPENDICES II and IV).

Smallwood estimation

Combined variable equation number 6 of APPENDIX I i.e. $V(S/W) = 4.030635 + 0.000171 D^2 H$ was used to estimate the smallwood volume against different diameter classes. Estimations are given in APPENDICES II and IV. These APPENDICES show total volume.

Conversion to Metric units

Finally selected equations for volume tables in the British units were converted to metric units. Volume tables in metric units were prepared using diameter breast height in centimetres and heights in metres. The converted equations in metric units are:

$$H = -9.911797 + 18.237253 \log D$$

$$V(\text{tim}) = 0.009709 + 0.0000317 D^2 H$$

$$V(S/W) = 0.114135 + 0.00000246 D^2 H$$

The estimations are given in Appendices III and V.

Local volume Tables

Volume tables were prepared by one inch diameter classes in the British units and two centimetre class intervals in metric units. These are produced in Appendices II and III respectively.

Standard Volume Tables

Volume tables given in Appendices IV and V were prepared by one inch/2 centimetre diameter classes and 5 feet/1.5 metres height classes in the British and metric units respectively. For example 60 feet height class includes trees having total height ranging from 58 to 62 feet in the British units. In metric units, 21 metres height class includes trees with total height from 20.26 to 21.75 metres. Figures in brackets are adjusted figures calculated proportionately on the bases of local volume table.

Acknowledgements

The guidance provided by Raja Walayat Hussain, Director Forestry Research Division is gratefully acknowledged.

The assistance rendered by the Field staff of Forest Research Division of Azad Kashmir specially Mr. Musaddiq Forester and Forest Mensuration Branch of Pakistan Forest Institute in collection, and computation of data is appreciated. Neat typing of tables by Mr. Khushhal Khan is commended.
