

A NOTE ON THE DENSITY OF PAKISTANI TIMBERS

Mohammad Ayaz*

Density is the best single criterion of wood. There is a close correlation between density and strength properties of timber (Kollmann, 1968 and Williams and Hamilton, 1961) and therefore, needs to be correctly determined. Available information on the density of Pakistani timbers is very old and is based on the works carried out in India before partition and the reported figures of density for different timbers are mostly from those areas which are located in that country. These density values often differ with observed density of timbers collected locally due to the differences of locality conditions in the two countries. Density determination of authentic wood samples of Pakistani origin was undertaken in the Forest Products Research Division, Pakistan Forest Institute, Peshawar. This note represents the results of the work carried out.

Each wood sample measured of approximately 15 x 10 x 4.5 cm in size and were prepared after sufficient air drying of timber specimens. The average moisture content of the timbers was found to be $8.9\% \pm 0.71$ as determined by oven dry method (Kollmann, 1968). Since density is also affected by growth rate (Kollmann, 1968) and in those timbers in which the rings were clear, average number of rings/cm was also obtained. Density was calculated (Kollmann, 1968) by dividing air dry weight by air dry volume of the samples and the values are reported as gm/cm³, and lb./ft³ in the table. The density value are mostly the average of more than one sample for each species. Some of the timbers originating from more than one locality. The density values in such cases represent both the average for the species and the average for each locality.

Table Showing the density figures of Pakistani Timbers.

Sl. No.	Botanical Name	Trade and Local Name	Locality	Av. No. of rings/cm	Av. density for the locality		Av. density for the species	
					gm/ cm ³	lb./ ft. ³	gm/ cm ³	lb./ ft. ³
1.	<i>Abies pindrow</i>		Fir, Partal, Kaghan paludar.	4.6	0.499	31	0.499	31
2.	<i>Acacia arabica</i>		Babul, kikar Hyderabad Sind	—	0.745	47	0.745	47
3.	<i>Acacia catechu</i>	Khair	Rawalpindi	—	1.037	65	1.037	65
