Abstract

The survey of soil nematodes of the West Azarbaijan province of Iran revealed the presence of predatory nematodes of the order Mononchida. A total of 36 soil samples were collected in the summer of 2014 from the rhizosphere of stone fruits in different areas of the province. Soil analysis results in the identification of 5 species of mononchid nematodes viz., *Anatonchus kashmirensis*, *A. tridentatus*, *Clarkus papillatus*, *Mylonchulus brachyurus* and *M. paitensis*. Among them, *A. kashmirensis* is recorded for the first time in Iran.

Keywords: Predatory nematodes, *Anatonchus kashmirensis*, new record, West Azarbaijan

The Mononchida (Jairajpuri, 1969) commonly known as mononchids, are predatory animals. They are found in a wide variety of habitats viz., terrestrial and aquatic (Ahmad & Jairajpuri, 2010). These predatory nematodes are relatively large about 0.6-7 mm long; some are known to be bacterial-feeding in some stages and also indicators of soil biological conditions (Yeates, 1987).

Ahmad & Jairajpuri (2010) provided the detailed review of the order Mononchida. Farahmand *et al.*, (2009a,b); Shokoohi *et al.*, (2013) and Kookhan *et al.*, (2014) studied this group from Iran and reported many species of the genera *Mononchus* Bastian, 1865, *Mylonchulus* Cobb, 1916 and some other genera of the order.

So far 20 nematode species of mononchids have been reported from Iran (Kookhan *et al.*, 2014). Very little is known about the soil-inhabiting nematode fauna of this region, therefore, the present survey was carried out. During the course of the present study, a total of five species of mononchids, representing three genera viz., *Anatonchus*, *Clarkus* and *Mylonchulus* were identified. A brief description of a new record,

Anatonchus kashmirensis Jairajpuri & Khan, 1982 along with morphometrics of some known species are provided in this paper.

Materials and Methods

Nematodes were extracted from soil samples by the centrifugal-flotation technique or extraction tray method, then fixed in TAF and mounted in anhydrous glycerin (Seinhorst, 1959). Measurements were taken by an ocular micrometer. Drawings were made using a drawing tube attached to an Olympus CH-2 microscope.

Results and Discussion

In the present study, five species belonging to three genera of order Mononchida were identified. These include two species of the genus *Anatonchus* (Cobb, 1916) De Coninck, 1939, a single species of the genus *Clarkus* Jairajpuri, 1970 and two species belong to the genus *Mylonchulus* (Cobb, 1916) Altherr, 1953. Identified species of these genera are *A. kashmirensis* Jairajpuri & Khan, 1982, *A. tridentatus* (De Man, 1876) De Coninck, 1939,

C. papillatus (Bastian, 1965) Jairajpuri, 1970, *M. brachyuris* and *M. paitensis*. The species *A. kashmirensis* reported for the first time from Iran. *A. tridentatus*, *C. papillatus*, *M. brachyuris* (Butschli, 1873) Cobb, 1917 and *M. paitensis* Yeates, 1992 have been reported earlier from Iran. A total of 20 nematode species of mononchids have so far been described or redescribed from the country (Table 1).

***Anatonchus kashmirensis* Jairajpuri & Khan, 1982
(Fig. 1 A-H, Fig. 2 A, B; Table 2)**

Female: Body almost cylindrical, ventrally curved after fixation. Cuticle smooth, 3-4 μm thick at midbody. Lip region offset. Amphidial openings oval, apertures 15% of lip region width. Buccal cavity broad, flattened at base, spherical, as wide as long, with heavily cuticularized vertical walls, 2 μm thick. Dorsal and subventral teeth almost equal in size and similar in position, located in the anterior half of the buccal cavity. Two foramina present at the base of buccal cavity lying close to each other. Nerve ring located at 35-37% of neck length, excretory pore at 40-42% of neck length. Tubercles prominent and well developed. Cardia conoid.

Reproductive system didelphic-amphidelphic, ovaries more or less straight, reflexed and with a single or two rows of oocytes; Sphincter at the oviduct-uterus junction well developed. Vulva not protruding and located near midbody at 66.3% of body length, advulval papillae not observed. Rectum 0.7-0.8 times anal body diameter. Tail conical elongated with rounded terminus, ventrally curved, 3.5 to 4.5 times anal body diameter. Caudal glands in tandem, spinneret opening terminal.

Male: Not found.

Remarks: The nematode specimens were collected from Uromieh, West Azarbaijan Province, Iran from the rhizosphere of stone

fruit. The genus *Anatonchus* belongs to family Anatonchidae Jairaipuri, 1969. Morphometrics data and general morphology of examined specimens agreed well with the original description given by Jairajpuri & Khan (1982) with minor differences in some measurements viz., greater length and b value ($L = 1.7\text{-}2.1$ vs 1.8 mm; $b = 4.0\text{-}4.5$ vs 3.6). This is the first report of *A. kashmirensis* from Iran.

***Anatonchus tridentatus* (de Man, 1876) De Coninck, 1939
(Fig. 2 C, D; Table 3)**

Remarks: Nematode specimens were collected from the same locality and host plant as above. Morphological characteristics and morphometric data of these specimens are quite similar to *A. tridentatus* given by De Coninck (1939) except in shorter body length ($L = 2.2\text{-}2.7$ vs. 2.8-3.6 mm). The species was previously reported by Loof *et al.*, 1990; Barooti, 1997; Kookhan *et al.*, 2014 from Iran.

***Clarkus papillatus* (Bastian, 1965) Jairajpuri, 1970
(Fig. 3 E, F; Table 3)**

Remarks: The specimens of *Clarkus papillatus* belong to family Mononchidae Filipjev, 1934 and were collected from the West Azarbaijan Province, Iran. Morphometric data and morphological features of the present populations agreed well with the description and measurements of Jairajpuri (1970). This species was earlier reported by many researchers from Iran (Loof *et al.*, 1990; Olia *et al.*, 2004; Farahmand *et al.*, 2009b; Kookhan *et al.*, 2014).

***Mylonchulus brachyuris* (Butschli, 1873)
Cobb, 1917
(Fig. 3 G, H; Table 3)**

Remarks: Specimens of *Mylonchulus brachyuris* of the family Mylonchulidae Jairajpuri, 1969 were collected from the same

Table 1. Reported species of Order Mononchida.

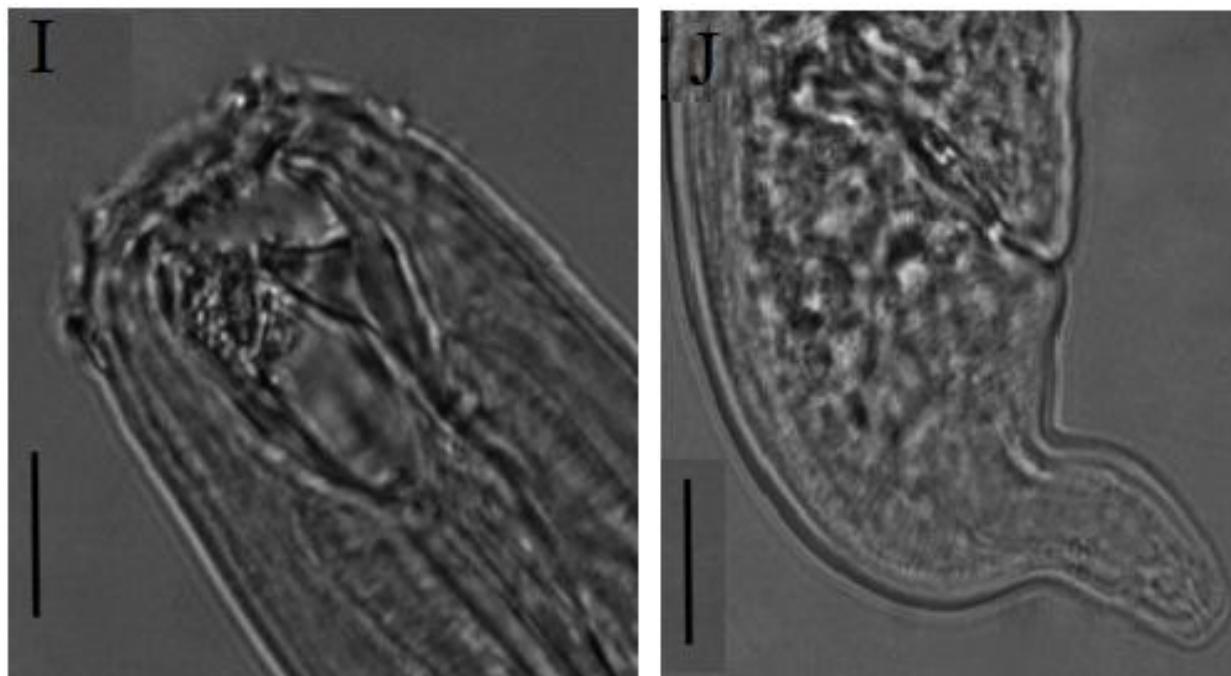

Fig. 4. (I-J). *Mylonchulus paitensis*: I. Anterior region; J. Posterior region.

province of Iran. Morphometrics and other morphological characters fits very well with the measurements given by many other researchers (Farahmand *et al.*, 2009; Ahmad & Jairajpuri, 2010). This species was also reported earlier by Loof *et al.*, 1990; Farahmand *et al.*, 2009a; Kookhan *et al.*, 2014.

***Mylonchulus paitensis* Yeates, 1992
(Fig. 4 I, J; Table 3)**

Remarks: Measurements of the specimens of *M. paitensis* come close to the original measurements given by Yeates (1992) with some variations that was due to ecological differences (buccal cavity length = 24-25 vs. 28-29 μm ; buccal cavity width = 15-16 vs. 17-18 μm). This species was reported before by Farahmand *et al.*, 2009a; Koohkan *et al.*, 2014 from Iran.
